

Lighting Design

Light is an unsubstantial medium that has an enormous influence on both our perceptions of a space's physical size, and our emotional response to it. O'Brien & Gere's lighting designs integrate all light sources and adapt them to the architectural space in order to provide visual acuity and control for all areas.

O'Brien & Gere's lighting services include design of new and expanded facilities, evaluation of existing facilities; and design of facility upgrades for existing industrial, municipal, institutional, and commercial buildings. The firm uses innovative technology in a cost and energy efficient manner to create the proper environment at the best possible price.

Services range from concept development to fully documented lighting design, including:

- Lighting design concepts
- Existing lighting energy analysis
- Existing lighting maintenance analysis
- Interior lighting design
- Exterior lighting design
- Landscape lighting design
- Lighting control systems
- Computer-based design and load calculations
- Computer-rendered designs with 3D modeling and analysis
- Construction plans and specifications
- Construction administration
- Project closeout report to reinforce design integrity

While it is possible for O'Brien & Gere to enter the design process at varying levels of completion, involvement in the earliest possible phase of the design process enables the firm to assist the client in selecting the best combination to unite all concepts of architecture and light.
